

After more than 10 years of development
at our own factory in Blankenburg/Harz now launched.

And what advantages this **world first offers over completely separate solar-systems**

- ☀ Just one single solar panel for water heating and photovoltaic to make use of both visible and invisible solar radiation and to retain the roof's symmetrical appearance.
- ☀ Even so, it remains the world's lightest combination solar panel with a weight of only 6 kg/m² providing double output (heat and electricity) and fully walkable
- ☀ Easy lockable by the use of press-locks for the antifreeze liquid and also for electricity
- ☀ While reducing installation costs by at least half, you achieve full roof quality (standing seam design), whether installing a new roof or undertaking building renovation (can be fitted on any existing surface, no need to remove the old, due to its light weight)
- ☀ In summer the water circulation cools the photovoltaic cells (1°C temperature reduction = 0,5% more electricity production); even in winter there is heat and electricity production with a snow and ice-free roof. Drainbackable.
- ☀ Good heat storage capacity, independent of the air, for domestic water and to bolster the central heating system, inexpensive electricity for your own use and to take advantage of the feed-in tariff
- ☀ State subsidy through BAFA (The Federal Office of Economics and Export Control) and EU Law (Renewable Energy Sources); tax advantages through AfA and VAT option.
